

ARCHITECTURE PATTERN

One application. Clear module boundaries. Shared institute data.

The product runs as one FastAPI application with separate domain modules. This avoids the cost and complexity of microservices while keeping each future module independently maintainable.

CLIENT LAYER

DELIVERY

APPLICATION LAYER

DATA LAYER

SYSTEM GUARDRAILS

PRIMARY DATA FLOW

A lead is converted, not copied.

The admissions module creates the starting record. Once confirmed, the same identity becomes the student's permanent institute profile and drives all later operations.

SHARED DATA ENTITIES

DATA RULE Student, parent, batch, and fee details are referenced across modules. They are never recreated in separate tables or separate screens.

DEPLOYMENT TOPOLOGY

A single production service keeps v1 reliable and economical.
